

Luna Imaging is a Sun Higher Education Library Solutions Partner. Luna provides software and services for building, managing and using image libraries over the Internet for the academic community and for other vertical markets in which Sun has significant presence including: GIS, Healthcare, Life Sciences, and Government.

Luna's Insight® software offers an integrated, feature-rich user environment to find, view, compare, annotate, and organize images, and to share and present them to others. Powerful data and search technology allows access to digital content across multiple independent image libraries, simultaneously, anywhere on the Internet. Insight also supports audio, video, and other rich media types in the same, shared workspace.

Luna's Insight® software was developed using Sun's Java technology and is deployed at leading higher education institutions using Sun solutions and the Solaris Operating Environment. Insight's highly configurable and dynamic management of media enables flexible distribution and scaling of digital assets, whether they reside locally or are dispersed across multiple systems in many locations. Insight integrates with other enterprise systems, delivering Insight functionality and media assets through an XML gateway.

Luna consults on end-to-end processes for building image resources, from planning and organization of source materials, to tracking and scheduling, through full set-up, staff training, and operation of digital studios at customer sites. Luna Imaging provides scanning, digital photography, post production and data integration to augment customer capabilities. Luna also offers complete facilities management solutions at client sites.
