Focus on Identity Management Learn more about interoperability between Sun and Microsoft

For years, Sun has provided user identity interoperability between Solaris, UNIX®, Linux, and Active Directory environments. Our Java System Identity Management product line provides open standards-based identity management features that can help unify even the most challenging heterogeneous environments.

Java System Access Manager helps secure access to Web applications within the enterprise and across business-to-business value chains. It provides open standards-based authentication and policy-based authorization with a single unified framework. It can support Web-based single sign-on across a wide range of Web applications. Policy agents for MSFT Internet Information Server allows users to protect web resources hosted on the Microsoft Web server. Sun Java System Access Manager is Windows 2003 logo certified

Java System Directory Server Enterprise Edition provides a solid foundation for identity management through a central repository for storing and managing identity profiles, access privileges, and application and network resource information. It integrates smoothly into multiplatform environments. Sun's Identity Synchronization for Windows provides bi-directional synchronization of user information between Active Directory and DSEE. Sun Java System Directory Server is being Windows 2003 logo certified.

NEW! Java System Federation Manager is a low-cost, secure solution for federation -- the secure management of digital identities across corporate boundaries between partners and service providers -- that can scale infinitely and deploy easily to partners. Federation Manager can be used to create application security mechanisms that are infinitely reusable and that enable authentication and access solutions to work together seamlessly across diverse Sun and Microsoft partner environments.

Java System Identity Auditor makes compliance related activities a seamless part of everyday enterprise business by streamlining and automating the often manual and fragmented processes associated with proving adherence to internal controls and preparing for audits. Designed to support heterogeneous IT environments and third-party platforms, Identity Auditor easily integrates with existing enterprise applications and identity management infrastructures.

Java System Identity Manager can help automate the process of creating and deleting user accounts when employees are hired and terminated. Java System Identity Manager can help reduce risk by automatically performing role-based user provisioning, password management, and identity synchronization across Solaris, Linux, Windows, VMS, and mainframe environments. Provision users to Active Directory and Exchange accounts, including the ability to create, update, and delete users. Sun Java System Identity Manager is Windows 2003 logo certified.

NEW! Java System Identity Manager Service Provider Edition provides highly scalable and reusable identity services to make it easy and cost-effective to deploy new applications. Highly integratable, it provides federated provisioning, registration and self-administration, data synchronization, delegated administration and auditing and reporting for Microsoft applications and identity management infrastructures.
